Starbucks Sales & Beverage Dashboard | Power BI

Project Overview

This project presents an interactive Starbucks dashboard created using **Microsoft Power BI** to explore beverage data and present key information through visualizations.

The dashboard helps users understand beverage characteristics such as calories, caffeine, and beverage categories through charts, cards, and slicers.

Project Objectives

- Analyse Starbucks beverage data.
- Compare nutritional information across beverages.
- Identify beverages based on calorie and caffeine values.
- Create interactive visualizations for easier data exploration.
- Build a professional dashboard for data-driven insights.

Tools & Technologies

- **Microsoft Power BI Desktop** — Dashboard development and visualization
- **Microsoft Excel / CSV** — Data storage and preparation, if applicable
- **GitHub** — Project documentation and version sharing

Dashboard Features

- **KPI Cards:** Display key metrics such as average calories.
- **Doughnut Chart:** Show the distribution of beverages by category.
- **Bar Charts:** Compare beverage values across different categories.
- **Min–Max Range Slicer:** Filter beverages by a selected numeric range, such as calories.
- **Beverage Comparison:** Explore differences between drinks.
- **Interactive Filters:** Allow users to explore the data dynamically.

Key Insights

The dashboard can be used to explore questions such as:

- Which beverages have the highest and lowest calorie values?
- How do nutritional values vary across beverage categories?
- Which beverages have higher caffeine content?
- How can customers compare different beverages using interactive filters?
